

Coding is not easy!

One would think that `Math.round(1005/1000*100)`
would give `Math.round(100.5)`
which is 101

But actually it gives `Math.round(100.49999)`
which is 100 and not 101.

It might not be that bad, except that

```
result = Math.round(1005/1000*100)
```

```
if(result>100)
```

would give an FALSE instead of TRUE!

*You might think: "1005 is only a single value",
but how many others are there?*

1005 → 100.49999

1035 → 103.49999

1045 → 104.5

1055 → 105.5

1215 → 121.5000000000000001

1255 → 125.499999

*This is one of the reasons you need testing to catch:
"You think you are right, but you are not"*

*This might seem like sacrilege to you,
but that is how things are.*

*Try it out For your self in Python or JavaScript!
In other languages you might need to Force it to
a 32bit Float*
